October 31, 2019

Mr. Paul Male, P.E. – Town Engineer
Town of Stillwater Town Hall
PO Box 700
Stillwater, New York 12170

RE: Traffic Assessment, Colonial Apartments, Colonial Road, Village of Stillwater, Saratoga County, New York; CM Project No. 119-103

Dear Mr. Male,

Creighton Manning Engineering, LLP (CM) has completed a traffic assessment for the proposed *Colonial Apartments* residential development located on Colonial Road in the Village of Stillwater. This evaluation is based on information provided in the "Concept Plan" dated March 18, 2019, prepared by Advance Engineering & Surveying, PLLC (see Attachment A). A map illustrating the project location is shown on Figure 1.

Project Description
The project includes construction of six apartment buildings totaling 198 residential units located on the west side of Colonial Road between Broughton Lane and Claremont Road (Hallum Road). Access to the site is provided by one full access driveway on Colonial Road. The project is expected to be completed and fully occupied in 2023.

1.0 Existing Conditions

Roadways Serving the Site
Colonial Road is a local north-south roadway that connects Stratton Lane in the Town of Stillwater and Broughton Lane in the Village of Stillwater. Colonial Road is a two-lane roadway with one 11 to 12-foot wide travel lane in each direction. There are no sidewalks on Colonial Road and the posted speed limit is 30-mph. Traffic volume data recorded by CM indicates that Colonial Road currently serves approximately 935 vehicles per day (vpd) in the project vicinity while the 85th percentile speed was measured to be approximately 38-mph. Land uses along the roadway are primarily residential or undeveloped land.

Study Area Intersections

- The Colonial Road/Ten Broeck Street intersection is a three-leg intersection operating under stop sign control on the westbound Ten Broeck Street approach. Each approach provides a single lane for shared travel movements. There are no sidewalks or crosswalks at this intersection.
- The Hudson Avenue (US Route 4)/Ten Broeck Street intersection is a three-leg intersection operating under stop sign control on the eastbound Ten Broeck Street approach. Each approach provides a single lane for shared travel movements. Sidewalks are provided along both sides of Hudson Avenue and a crosswalk is striped across the eastbound intersection approach.
- The Colonial Road/Claremont Street (Hallum Road) intersection is a three-leg intersection operating under stop sign control on the eastbound Claremont Street approach. Each approach provides a single lane for shared travel movements. There are no sidewalks or crosswalks at this intersection.

- The Colonial Road/Broughton Lane intersection is a three-leg intersection operating under stop sign control on the southbound Colonial Road approach. Each approach provides a single lane for shared travel movements. There are no sidewalks or crosswalks at this intersection.
- The Major Dickinson Avenue/Broughton Lane intersection is a four-leg intersection operating under stop sign control on the eastbound Broughton Lane approach. The east leg of Broughton Lane is a single lane roadway providing one-way travel eastbound towards Hudson Avenue (US Route 4). Each approach provides a single lane for shared travel movements. There are no sidewalks or crosswalks at this intersection.
- The Major Dickinson Avenue/General Schuyler Lane intersection is a three-leg intersection operating under stop sign control on the westbound General Schuyler Lane approach. Each approach provides a single lane for shared travel movements. A sidewalk is provided on the east side of Major Dickinson Avenue at this intersection. There are no marked crosswalks at this intersection.
- The Hudson Avenue/Major Dickinson Avenue intersection is a three-leg intersection operating under stop sign control on the southbound Major Dickinson Avenue approach. Each approach provides a single lane for shared travel movements. Sidewalks are provided on both sides of Hudson Avenue and on the west side of Major Dickinson Avenue. There are no marked crosswalks at this intersection.

Pedestrian/Bicycle Accommodations

Sidewalks are present on both sides of Hudson Avenue within the study area. An approximate 470-foot long sidewalk is also provided on the west side of Major Dickinson Avenue from Hudson Avenue to Rundle Lane. In addition, a sidewalk is also provided on the east side of Major Dickinson Avenue from Rundle Lane to the southern boundary of the *Major Dickinson Children's Park*. It is noted that there are no sidewalks provided north of the park on Colonial Road.

Table 1 summarizes the peak hour pedestrian and bicycle activity observed during the turning movement counts at the study area intersections.

Table 1 – Pedestrian and Bicyclist Activity

Location	AM Peak Hour		PM Peak Hour	
	Pedestrians	Bicyclist	Pedestrians	Bicyclist
Colonial Road/Ten Broeck Street	0	2	0	2
Hudson Avenue/Ten Broeck Street	2	6	1	1
Colonial Road/Claremont Road (Hallum Road)	0	3	0	0
Colonial Road/Broughton Lane	0	1	2	2
Broughton Lane/Major Dickinson Avenue	0	1	1	0
Major Dickinson Avenue/General Schuyler Lane	4	2	6	4
Hudson Avenue/Major Dickinson Avenue	0	0	0	0

Data Collection

Intersection turning movement counts were conducted at the study area intersections on Wednesday July 17, 2019 during the morning peak period from 7:00 to 9:00 a.m. and during the afternoon peak period from 4:00 to 6:00 p.m. which coincides with peak operating conditions of the site and adjacent street traffic. It is noted that the Major Dickinson Avenue/General Schuyler Lane intersection was re-counted on Wednesday July 24, 2019 due to an equipment failure. An automatic traffic recorder (ATR) was installed on Colonial Road along the project frontage to record hourly traffic volumes and vehicle speeds from

Tuesday July 16, 2019 to Thursday July 18, 2019. The raw turning movement count data and ATR data is included under Attachment B. The existing peak hour traffic volumes are shown on Figure 2 and form the basis for all traffic forecasts.

Accident Analysis

An accident analysis was performed in accordance with NYS Highway Design Manual Chapter 5. Accident data was requested from NYSDOT to quantify the number of accidents, determine an accident rate, and identify any accident patterns or concentrations at the study area intersections. Safety Information Management System (SIMS) and Accident Location Information System (ALIS) data was provided by NYSDOT at these intersections for a three-year period from April 1, 2016 through March 31, 2019. Table 2 summarizes the predominant accident types for the intersection and also provides the intersection crash rate which can be compared to the State-wide average crash rates for similar intersections. The statewide average accident rate for three and four-way, unsignalized intersections with single lane approaches is 0.18 and 0.29 accidents per million entering vehicles (ACC/MEV), respectively. These rates were used for comparison to all study area intersections. It is noted that the character of Village streets may be different than state highways; therefore, the comparison to the statewide average crash rate may not be as applicable to intersections consisting of Village streets.

Table 2 – Accident Type and Severity

Intersection	Collision Severity				Collision Type			Rate
	Non-Reportable	Property Damage	Injury	Fatal	Rear End	Fixed Object	Total	
Colonial Road/Ten Broeck Street	0	0	0	0	0	0	**0**	**0.00**
Hudson Avenue/Ten Broeck Street	1	0	0	0	1	0	**1**	**0.20**
Colonial Road/Claremont Road (Hallum Road)	0	0	0	0	0	0	**0**	**0.00**
Colonial Road/Broughton Lane	0	0	0	0	0	0	**0**	**0.00**
Broughton Lane/Major Dickinson Avenue	0	0	0	0	0	0	**0**	**0.00**
Major Dickinson Avenue/General Schuyler Lane	0	0	0	0	0	0	**0**	**0.00**
Hudson Avenue/Major Dickinson Avenue	1	1	0	0	1	1	**2**	**0.23**

There were three total accidents at the seven study area intersections. All three of the accidents involved property damage or were non-reportable accidents which are collisions that result in damage less than $1,000. There were no injury or fatal accidents. The one accident located at the Hudson Avenue/Ten Broeck Street intersection involved a rear end collision with three southbound vehicles and was the result of following too closely. The remaining two accidents were reported at the Hudson Avenue/major Dickinson Avenue intersection. They involved a collision with a tree branch that damaged the vehicle and a rear end collision between two northbound vehicles that was the result of following too closely. The predominant accident type at the study area intersections are rear-end collisions; however, they are associated with driver inattention and not the result of geometric or operational issues with the intersections. A review of the accident rates at the Ten Broeck Street and Major Dickinson Avenue intersections on Hudson Avenue are consistent with the statewide average accident rates for similar intersections. An accident summary (TE-213 equivalent) at the study area intersections is included under Attachment C.

2.0 Sight Distance Analysis

The available intersection sight distance from the proposed Site Driveway intersection was measured from the perspective of a vehicle looking in both directions along Colonial Road to determine if adequate sight lines are provided. The intersection sight distance looking straight ahead for vehicles traveling north on Colonial Road turning left into the proposed Site Driveway was also measured, as illustrated in Diagram 1. In addition, intersection sight distance at the Hudson Avenue/Major Dickinson Avenue intersection was also measured from the perspective of a vehicle looking in both directions along Hudson Avenue. The available intersection sight distance on a side street or driveway should provide drivers a sufficient view of the intersecting highway to allow vehicles to enter or exit the intersection without excessively slowing vehicles traveling at or near the operating speed on the intersecting mainline.

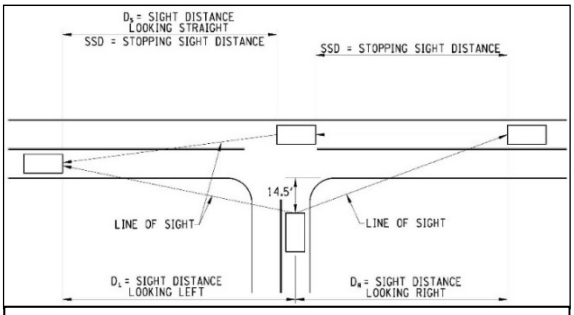

Diagram 1 – Generic Intersection and Stopping Sight Distance Measurements

Stopping sight distance (the length of roadway ahead that is visible to the driver) was also measured on Colonial Road at the proposed Site Driveway intersection and on Hudson Avenue at the Major Dickinson Avenue intersection. The available stopping sight distance on a roadway should be of sufficient length to enable a vehicle traveling at or near the operating speed to stop before reaching a stationary object in its path.

The Village speed limit is 30-mph. Traffic speed data measurements collected as part of this study show that the 85th percentile speed on Colonial Road is approximately 38-mph. The available sight distances shown in Table 3 are compared to the guidelines presented in AASHTO's *A Policy on Geometric Design of Highways and Streets*, 2011 and NYSDOT design guidance (EB 17-007) for the applicable 40-mph operating speed on Colonial Road and a 35-mph operating speed on Hudson Avenue (posted speed limit plus 5-mph).

Table 3 – Sight Distance Summary (Feet)

Intersection		Intersection Sight Distance[1]				Stopping Sight Distance[2]	
		Right Turn from Side Road (D_L)	Left Turn from Side Road		Left Turn from Colonial Rd/ Hudson Ave (D_S)	SSD_{NB}	SSD_{SB}
			Looking Left (D_L)	Looking Right (D_R)			
Colonial Road/ Site Driveway	Available	830	830	450	830	450	805
	Recommended[3]	385	445	445	285	275	275
Hudson Avenue/ Major Dickinson Ave	Available	275	275	625	570	>800	520
	Recommended[4]	335	390	390	285	225	225

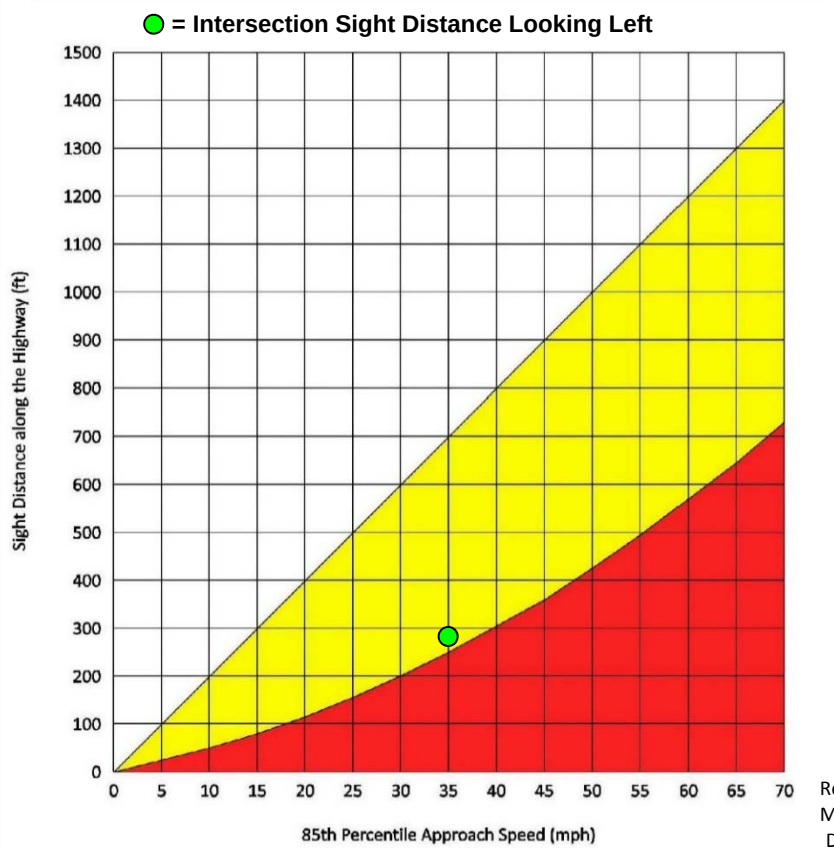
[1] = Intersection sight distance is measured at an eye height of 3.5-ft and object height of 3.5-ft.
[2] = $SSD_{NB,SB}$ = Stopping sight distance measured for a 2-foot object located in the path of vehicles traveling northbound and southbound on Colonial Road and Hudson Avenue.
[3] = Sight distance measurements are compared to AASHTO recommended distances for a 40-mph operating speed on Colonial Road.
[4] = Sight distance measurements are compared to AASHTO recommended distances for a 35-mph operating speed on Hudson Avenue.

Colonial Road/Site Driveway – A review of the available intersection and stopping sight distances at the Site Driveway on Colonial Road indicate that they meet AASHTO guidelines for the applicable operating speed.

Hudson Avenue/Major Dickinson Avenue – The available stopping sight distances for vehicles traveling northbound and southbound along Hudson Avenue exceed AASHTO guidelines for a 35-mph operating speed. In addition, the available intersection sight distance looking straight to make a left turn from Hudson Avenue onto Major Dickinson Avenue, and the available intersection sight distance looking right to make a left turn from Major Dickinson Avenue onto Hudson Avenue meet AASHTO guidelines for the 35-mph operating speed.

It is noted that the available intersection sight distance looking left from Major Dickinson Avenue is limited by the existing *Glens Carpet & Linoleum* building and is less than AASHTO guidelines to make a left or right turn from Major Dickinson Avenue onto Hudson Avenue. Figure 2C-101 found in the New York State Supplement (NYS Supplement) to the National Manual for Uniform Traffic Control Devices (NMUTCD) provides guidance for the installation of "Intersection Warning" signs as mitigation for sight distance. A review of Figure 2C-101 (see figure below) indicates that the available sight distance looking left at the Hudson Avenue/Major Dickinson Avenue intersection is less than desirable but not critically limited for the 35-mph operating speed.

Figure 2C-101. Guide for Intersection Warning Sign Use



Reference: NYS Supplement to the Manual on Uniform Traffic Control Devices for Streets and Highways (2009 Edition), page 119

A "No Parking This Side" sign is provided on the west side of Hudson Avenue approximately 285-feet north of Major Dickinson Avenue which ensures sight lines looking left are not impacted by on-street parking. It is noted that vehicles regularly park on the west side of Hudson Avenue between the Lake Street and School Street intersections even though signage is not provided that permits on-street parking in this area. The Applicant should work with the Village to establish permitted on-street parking areas on Hudson Avenue. It is recommended that the Village consider obtaining a NYSDOT permit to install "No Parking Any Time" signs (NMUTCD R7-1) on the northwest corner of the Hudson Avenue/Lake Street intersection with an arrow pointing left and on the southwest corner of the Hudson Avenue/School Street intersection with an arrow pointing to the right. These signs would prohibit on-street parking on the west side of the Hudson Avenue south of Lake Street and north of School Street and would ensure that sight lines looking left from Major Dickinson Avenue are maintained. A review of the crash summary does not suggest that an accident problem exists at the Hudson Avenue/Major Dickinson Avenue intersection since there are no right-angle or left-turn crashes; therefore, no additional mitigation is recommended at this time.

R7-1

3.0 Traffic Assessment

Trip Generation

Trip generation determines the quantity of traffic expected to travel to or from the project site. The Institute of Transportation Engineers (ITE) *Trip Generation, 10th edition*, is the industry standard used for estimating trip generation for proposed land uses based on data collected at similar uses. The trip generation for the proposed project was estimated using land use code (LUC) 220 for Multi-Family Housing (Low Rise). Table 4 summarizes the trip generation estimate for the AM and PM peak hours.

Table 4 – Trip Generation Summary

Land Use	LUC	AM Peak Hour			PM Peak Hour		
		Enter	Exit	Total	Enter	Exit	Total
Colonial Apartments – 198 Units	220	21	70	91	68	40	108

The table indicates that the project is expected to generate 91 new trips during the AM peak hour and 108 new trips during the PM peak hour.

Future Traffic Volumes

To evaluate the impact of the proposed development, traffic projections were prepared for the expected year of completion. Full build-out of the project is expected in the year 2023. Information provided by the Capital District Transportation Committee (CDTC) indicates that traffic volumes in the study area have increased by approximately 0.7 percent per year over the last several years. Therefore, the 2019 Existing traffic volumes were increased by 0.7 percent per year for four years to represent general growth in the study area anticipated by the 2023 design year.

In addition to the background traffic growth, vehicle trips associated with the following planned or approved developments within the project area were considered when developing No-Build traffic volumes:

- *Bocrest Fields Apartments* – 260 Unit residential development located on Halfway House Road.
- *Turning Point Apartments* – 156 Unit residential development located on Brickyard Road
- *Saratoga Hills* – Expansion of existing 180 residential PDD to allow for approximately 170 additional mobile homes.

The 2023 No-Build traffic volumes are shown on Figure 3 and represent expected traffic volumes in 2023 without construction of *Colonial Apartments*.

Traffic generated by the proposed project was distributed to the adjacent roadways based on existing observed travel patterns in the project area and probable travel routes for residents of the proposed development. It is expected that approximately 35 percent will travel to and from the north on Colonial Road while 65 percent travel to and from the south on Colonial Road. The trip distribution patterns and associated site-generated traffic volumes for the proposed development are shown on Figure 4 and 5. The site generated trips were added to the 2023 No-Build traffic volumes resulting in the 2023 Build traffic volumes for the weekday AM and PM peak hours, shown on Figure 6.

Traffic Operations

Intersection Level of Service (LOS) and capacity analysis relate traffic volumes to the physical characteristics of an intersection. Intersection evaluations were made using Synchro Software which automates the procedures contained in the *Highway Capacity Manual.* Table 5 summarizes the results of the level of service calculations for the proposed project. The detailed level of service analyses are included under Attachment C.

Table 5 –Level of Service Summary

Intersection		Control	AM Peak Hour			PM Peak Hour		
			2019 Existing	2023 No-Build	2023 Build	2019 Existing	2023 No-Build	2023 Build
Colonial Rd/Ten Broeck St		TW						
Ten Broeck St WB	LR		A (9.2)	A (9.2)	A (9.4)	A (9.0)	A (9.0)	A (9.4)

Major Dickinson Ave/General Schuyler Ln		TW						
General Schuyler Ln WB	LR		A (8.5)	A (8.5)	A (8.5)	A (8.9)	A (8.9)	A (9.0)
Major Dickinson Ave SB	L		A (0.0)	A (0.0)	A (7.3)	A (7.4)	A (7.4)	A (7.4)
Hudson Ave/Major Dickinson Ave		TW						
Hudson Ave EB	L		A (8.2)	A (8.2)	A (8.3)	A (7.9)	A (8.0)	A (8.1)
Major Dickinson Ave SB	LR		B (11.0)	B (11.3)	B (11.8)	B (10.1)	B (10.6)	B (10.7)
Colonial Rd/Site Driveway		TW						
Colonial Rd NB	L		--	--	A (7.4)	--	--	A (7.5)
Site Driveway EB	LR		--	--	A (9.2)	--	--	A (9.3)

X (Y.Y) = Level of service (Average delay in seconds per vehicle)
TW=Two-Way Stop Controlled Intersection
EB, WB, NB, SB = Eastbound, Westbound, Northbound, and Southbound intersection approaches
L, T, R = Left-turn, Through, and/or Right-turn movements

The level of service analysis indicates that all approaches at the study area intersections generally operate at LOS A/B during the peak hours and will continue to do so through Build conditions. With the additional traffic generated by the *Colonial Apartment*, vehicle delay will increase by approximately one second per vehicle or less. No capacity improvements are recommended. The Site Driveway is expected to operate at LOS A during both peak hours. It is recommended that the Site Driveway operate under stop sign control with a single lane entering and exiting the site.

4.0 Roadway Evaluation and Access

Capacity and Roadway Character

Roadway capacity criteria provided by the Capital District Transportation Council (CDTC) indicates that local roadways have a peak hour capacity of 625 vehicles in each direction per hour while arterials and collector roads have a capacity of 1,000 vehicles in each direction per hour.[1] Table 6 summarizes the AM and PM peak hour volumes expected on roadway segments between various study area intersections during No-Build and Build traffic volume conditions.

Table 6 – Project Area Roadway Segment Capacity Assessment

Roadway Segment	Peak Hour Traffic Volumes				
	2023 No-Build		2023 Build		Segment Capacity[1] (by Direction)
	NB/EB	SB/WB	NB/EB	SB/WB	
AM Peak Hour					
Colonial Road (north of Broughton Lane)	21	42	35	87	625
Broughton Lane (east of Colonial Road)	43	21	88	35	625
Major Dickinson Avenue (south of Brought Lane)	26	44	40	91	625
Ten Broeck Street (east of Colonial Road)	21	5	28	7	625
Hudson Avenue (south of Major Dickinson Avenue)	239	434	250	469	1,000
Hudson Avenue (north of Ten Broeck Street)	144	198	144	198	1,000
PM Peak Hour					
Colonial Road (north of Broughton Lane)	60	38	104	64	625
Broughton Lane (east of Colonial Road)	38	60	64	104	625
Major Dickinson Avenue (south of Brought Lane)	83	40	127	66	625
Ten Broeck Street (east of Colonial Road)	10	14	14	21	625
Hudson Avenue (south of Major Dickinson Avenue)	579	307	613	327	1,000
Hudson Avenue (north of Ten Broeck Street)	273	150	273	150	1,000

All of the study area roadways are considered local roadways and have a segment capacity of 625 vehicles in each direction with the exception of Hudson Avenue which is a minor arterial roadway that has a segment capacity of 1,000 vehicles in each direction. A review of Table 6 indicates that all of the study area roadways will continue to provide adequate capacity after build-out of the *Colonial Apartment* project. No segment capacity related mitigation is recommended to accommodate the site.

As specific review of the traffic volume data shows that Colonial Road will serve approximately 63 AM peak hour trips and approximately 98 PM peak hour trips adjacent to the proposed site during No-Build conditions. Colonial Road will continue to provide adequate capacity with the addition of approximately 59/70 AM and PM peak hour trips from the proposed site since the peak hour will remain well below the 625 vehicles per hour per direction capacity. Additional traffic from the project will not change the

1 The Metropolitan Congestion Management Process. Albany, NY: Capital District Transportation Committee, 2007.

character of Colonial Road since it already accommodates general commuter traffic associated with residential land uses.

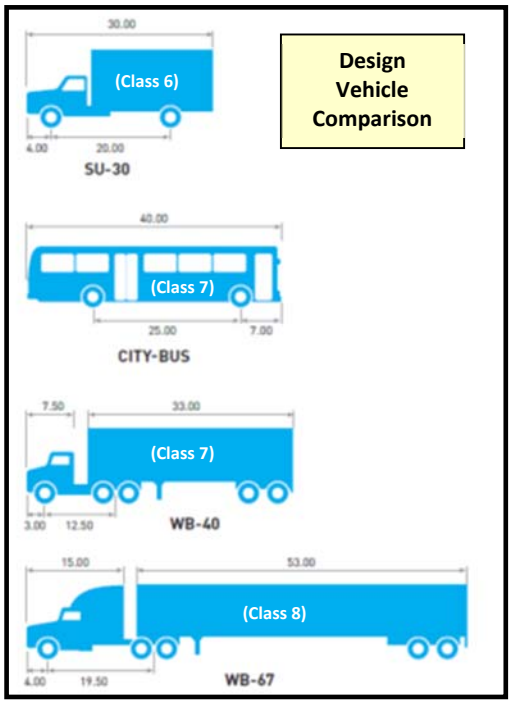
Heavy Vehicle/Truck Access

A detailed review of the ATR data indicates that Colonial Road has approximately two percent heavy vehicles. Table 7 summarizes existing heavy vehicles on Colonial Road.

Table 7 – Colonial Road Traffic Volume Summary

Roadway Segment	Traffic Volumes											
	Northbound						Southbound					
	Passenger Cars	Bus	2 Axle Truck	3 Axle Truck	5 Axle Truck	Heavy Vehicle %	Passenger Cars	Bus	2 Axle Truck	3 Axle Truck	5 Axle Truck	Heavy Vehicle %
Colonial Road	422	1	6	2	1	2.3%	422	1	7	1	1	2.3%

The Village of Stillwater requested an assessment of potential truck routes between Hudson Avenue and the proposed development due to historical issues with heavy vehicles negotiating turns on the adjacent roadway network (particularly near the *Major Dickinson Children's Park)*. A preliminary review of the roadway pavement indicates that Colonial Road, Broughton Lane, Major Dickinson Avenue, and Ten Broeck Street are in fair to good condition. The street network can accommodate the minor amount of future truck traffic generated by the site which will generally consist of moving company vehicles, garbage trucks, etc. It is not anticipated that large tractor trailers would need to access the apartment development. An AutoTurn assessment of the study area intersections was conducted to determine if the following trucks can negotiate the turn's necessary to access the proposed development:



- Single Unit Truck (SU-30) – 2-axle trucks similar to moving trucks (U-Haul) and delivery trucks (FedEx)
- Intermediate Semitrailers (WB-40) – 3 to 5 axle trucks similar to large moving trucks and firetrucks
- Interstate Tractor Trailers (WB-67) – 5-axle and greater trucks similar to large semi-trucks

The AutoTurn assessment indicates that SU-30 and WB-40 trucks can negotiate the turns as shown on the AutoTurn Aerial images below and included under Attachment D. It is noted that in some instances, the WB-40 truck must slightly off-track into the opposing lane in order to negotiate some of the turns; however, it is not anticipated that this will have a significant impact to the roadway system due to the low traffic volumes on the Village streets as shown on Table 6 and since the proposed residential development will not generate a significant number of trucks. The assessment also indicates that WB-67 trucks cannot make most of the turns to/from Colonial Road to Broughton Lane and Ten Broeck Street without off-tracking onto the adjacent properties; therefore, it is recommended that these types of trucks be restricted from using local Village streets via signage. It is noted that available NMUTCD signing does not restrict trucks by length. Truck classification are typically based on the maximum load weight of the truck.

Trucks are classified more broadly by the Federal Highway Administration (FHWA) which groups Classes 1–2 as *light duty*, Classes 3–6 as *medium duty*, and Classes 7–8 as *heavy duty*. A review of typical truck weights by classification (included under Attachment D) indicates that the existing roadway can accommodate Class 1 through Class 7. In order to restrict large commercial tractor trailers found in Class 8 (such as WB-67 trucks), it is recommended that the Village consider installing "Weight Limit 15 Ton" signs (NMUTCD R12-1) on Major Dickinson Avenue and on Ten Broeck Street near Hudson Avenue to restrict larger commercial trucks from using local Village streets.

R12-1

Aerial AutoTurn Assessment

Pedestrian Access

A review of the site plan indicates that sidewalks will be provided along the internal site roadways which will also provide direct access to Colonial Road. It is noted that sidewalks are not provided on Colonial Road; therefore, the Applicant will work with the Village to explore the feasibility of providing a pedestrian connection that will extend approximately 400-feet south from the site driveway to the southwest corner of the Colonial Road/Broughton Lane intersection. It is anticipated that a crosswalk with ADA compliant ramps and landings would be installed on the south leg of the intersection which would provide access to the *Major Dickinson Children's Park.* The Applicant is in the process of surveying Colonial Road to determine if the sidewalk can be constructed within the existing right-of-way (ROW). If adequate ROW is not available, the Applicant is prepared to work with the adjacent property.

5.0 Conclusions

The proposed project includes construction of 198 apartment units on Colonial Road with a single full access driveway provided approximately 380-feet north of Broughton Lane. The proposed project is expected to generate 91 new vehicle trips during the AM peak hour and 108 new vehicle trips during the PM peak hour. The project is expected to be completed and fully occupied in 2023. The following conclusions are noted:

- All study area intersections will continue to operate at LOS A/B during both peak hours with minor increases in average vehicle delay after development of the site.
- The Site Driveway intersection on Colonial Road will provide good levels of service after development of the *Colonial Apartments.* It is recommended that the Site Driveway operate under stop sign control with a single lane entering and exiting the site.
- The sight distance analysis indicates that adequate sight lines will be provided at the Site Driveway for the applicable 40-mph operating speed.
- The available sight distance looking left at the Hudson Avenue/Major Dickinson Avenue intersection is less than desirable but not critically limited for the operating speed. The Applicant should work with the Village to establish permitted on-street parking areas on Hudson Avenue. It is recommended that the Village consider obtaining a NYSDOT permit to install "No Parking Any Time" signs on the northwest corner of the Hudson Avenue/Lake Street intersection with an arrow pointing to the left and on the southwest corner of the Hudson Avenue/School Street intersection with an arrow pointing to the right. These signs would prohibit on-street parking on the west side of the Hudson Avenue south of Lake Street and north of School Street and would ensure that sight lines looking left from Major Dickinson Avenue are maintained.
- It is recommended that the Village establish a local law denoting where on-street parking is permitted on Hudson Avenue and obtain a permit from NYSDOT to install the appropriate signage which would ensure that sight lines looking left from Major Dickinson Avenue are maintained. A review of the crash summary does not suggest that an accident problem exists at this intersection since there are no right-angle or left-turn crashes; therefore, no additional mitigation is recommended at this time.
- A review of roadway capacity indicates that all of the study area roadways will continue to provide adequate capacity after build-out of the *Colonial Apartment* project. No segment capacity related mitigation is recommended to accommodate the site.
- Sidewalks will be provided along the internal site roadways which will also provide direct access to Colonial Road. The Applicant will work with the Village to explore the feasibility of providing a pedestrian connection that will extend approximately 400-feet south from the site driveway to the southwest corner of the Colonial Road/Broughton Lane intersection. It is anticipated that a crosswalk with ADA compliant ramps and landings would be installed on the south leg of the intersection which would provide access to the *Major Dickinson Children's Park.* The Applicant is in the process of surveying Colonial Road to determine if the sidewalk can be constructed within the existing ROW.
- The AutoTurn assessment indicates that SU-30 and WB-40 trucks can negotiate the turns to access the proposed site; however, WB-67 trucks cannot make most of the turns to/from Colonial Road to Broughton Lane and Ten Broeck Street and will off-track onto the adjacent properties. A review of typical truck weights by classification indicates that the existing roadway can accommodate Class 1 through Class 7. In order to restrict large commercial tractor trailers found in Class 8, it is recommended that the Village consider installing "Weight Limit 15 Ton" signs on Major Dickinson

Avenue and on Ten Broeck Street near Hudson Avenue to restrict larger commercial trucks from using local Village streets.

Please call our office if you have any questions or comments regarding the above analysis.

LOS Definitions

The following is an excerpt from the Highway Capacity Manual, 6th Edition (HCM).

Level of Service for Signalized Intersections

Level of Service (LOS) can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach. Control delay *and* volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. Delay quantifies the increase in travel time due to traffic signal control. It is also a surrogate measure of driver discomfort and fuel consumption. The v/c ratio quantifies the degree to which a phase's capacity is utilized by a lane group. The following paragraphs describe each LOS.

LOS A describes operations with a control delay of 10 s/veh or less and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

LOS B describes operations with control delay between 10 and 20 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

LOS C describes operations with control delay between 20 and 35 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual *cycle failures* (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

LOS D describes operations with control delay between 35 and 55 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

LOS E describes operations with control delay between 55 and 80 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

LOS F describes operations with control delay exceeding 80 s/veh or a v/c ratio greater than 1.0. This level is typically assigned when the v/c ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

A lane group can incur a delay less than 80 s/veh when the v/c ratio exceeds 1.0. This condition typically occurs when the cycle length is short, the signal progression is favorable, or both. As a result, both the delay and v/c ratio are considered when lane group LOS is established. A ratio of 1.0 or more indicates that cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 s/veh represents failure from a delay perspective).

Average control delay and queue length at roundabout controlled intersections are calculated using SIDRA Intersection. The physical geometry such as entry lane width and approach flare, and traffic volume at the roundabout are factors that influence the intersection's performance. The average delay reported using SIDRA Intersection is based on the signalized HCM Method of Delay for Level-of-Service.

Level of Service Criteria for Unsignalized Intersections

Level of service (LOS) for Two-Way Stop-Controlled (TWSC) intersections is determined by the computed or measured control delay. For motor vehicles, LOS is determined for each minor-street movement (or shared movement) as well as major-street left turns by using criteria given in Exhibit 20-2. LOS is not defined for the intersection as a whole or for major-street approaches for three primary reasons: (a) major-street through vehicles are assumed to experience zero delay; (b) the disproportionate number of major-street through vehicles at a typical TWSC intersection skews the weighted average of all movements, resulting in a very low overall average delay for all vehicles; and (c) the resulting low delay can mask important LOS deficiencies for minor movements. LOS F is assigned to the movement if the volume-to-capacity (v/c) ratio for the movement exceeds 1.0, regardless of the control delay.

The LOS criteria for TWSC intersections are somewhat different from the criteria used in Chapter 18 for signalized intersections, primarily because user perceptions differ among transportation facility types. The expectation is that a signalized intersection is designed to carry higher traffic volumes and will present greater delay than an unsignalized intersection. Unsignalized intersections are also associated with more uncertainty for users, as delays are less predictable than they are at signals, which can reduce users' delay tolerance.

The LOS criteria for All-Way Stop-Controlled (AWSC) intersections are given in Exhibit 21-8. LOS F is assigned if the v/c ratio of a lane exceeds 1.0, regardless of the control delay. For assessment of LOS at the approach and intersection levels, LOS is based solely on control delay.

Exhibits 20-2/21-8:
Level-of-Service Criteria for Stop Controlled Intersections

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c ≤ 1.0	v/c ≥ 1.0
10.0	A	F
>10.0 and ≤ 15.0	B	F
>15.0 and ≤ 25.0	C	F
>25.0 and ≤ 35.0	D	F
>35.0 and ≤ 50.0	E	F
>50.0	F	F

LOS Definitions

The following is an excerpt from the Highway Capacity Manual, 6th Edition (HCM).

Level of Service for Signalized Intersections

Level of Service (LOS) can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach. Control delay *and* volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. Delay quantifies the increase in travel time due to traffic signal control. It is also a surrogate measure of driver discomfort and fuel consumption. The v/c ratio quantifies the degree to which a phase's capacity is utilized by a lane group. The following paragraphs describe each LOS.

LOS A describes operations with a control delay of 10 s/veh or less and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

LOS B describes operations with control delay between 10 and 20 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

LOS C describes operations with control delay between 20 and 35 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual *cycle failures* (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

LOS D describes operations with control delay between 35 and 55 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

LOS E describes operations with control delay between 55 and 80 s/veh and a v/c ratio no greater than 1.0. This level is typically assigned when the v/c ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

LOS F describes operations with control delay exceeding 80 s/veh or a v/c ratio greater than 1.0. This level is typically assigned when the v/c ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

A lane group can incur a delay less than 80 s/veh when the v/c ratio exceeds 1.0. This condition typically occurs when the cycle length is short, the signal progression is favorable, or both. As a result, both the delay and v/c ratio are considered when lane group LOS is established. A ratio of 1.0 or more indicates that cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 s/veh represents failure from a delay perspective).

Average control delay and queue length at roundabout controlled intersections are calculated using SIDRA Intersection. The physical geometry such as entry lane width and approach flare, and traffic volume at the roundabout are factors that influence the intersection's performance. The average delay reported using SIDRA Intersection is based on the signalized HCM Method of Delay for Level-of-Service.

Level of Service Criteria for Unsignalized Intersections

Level of service (LOS) for Two-Way Stop-Controlled (TWSC) intersections is determined by the computed or measured control delay. For motor vehicles, LOS is determined for each minor-street movement (or shared movement) as well as major-street left turns by using criteria given in Exhibit 20-2. LOS is not defined for the intersection as a whole or for major-street approaches for three primary reasons: (a) major-street through vehicles are assumed to experience zero delay; (b) the disproportionate number of major-street through vehicles at a typical TWSC intersection skews the weighted average of all movements, resulting in a very low overall average delay for all vehicles; and (c) the resulting low delay can mask important LOS deficiencies for minor movements. LOS F is assigned to the movement if the volume-to-capacity (v/c) ratio for the movement exceeds 1.0, regardless of the control delay.

The LOS criteria for TWSC intersections are somewhat different from the criteria used in Chapter 18 for signalized intersections, primarily because user perceptions differ among transportation facility types. The expectation is that a signalized intersection is designed to carry higher traffic volumes and will present greater delay than an unsignalized intersection. Unsignalized intersections are also associated with more uncertainty for users, as delays are less predictable than they are at signals, which can reduce users' delay tolerance.

The LOS criteria for All-Way Stop-Controlled (AWSC) intersections are given in Exhibit 21-8. LOS F is assigned if the v/c ratio of a lane exceeds 1.0, regardless of the control delay. For assessment of LOS at the approach and intersection levels, LOS is based solely on control delay.

Exhibits 20-2/21-8:
Level-of-Service Criteria for Stop Controlled Intersections

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c ≤ 1.0	v/c ≥ 1.0
10.0	A	F
>10.0 and ≤ 15.0	B	F
>15.0 and ≤ 25.0	C	F
>25.0 and ≤ 35.0	D	F
>35.0 and ≤ 50.0	E	F
>50.0	F	F
